1. PREFACE

1.1. PURPOSE OF THIS DOCUMENT

This document will assist the user to setup the DF1 Router to allow a PanelView 800 application to communicate to an SLC device’s DF1 port via EtherNet/IP.

1.2. ADDITIONAL INFORMATION

The following resources contain additional information that can assist the user with the module installation and operation.

<table>

1.3. SUPPORT

Technical support will be provided via the Web (in the form of user manuals, FAQ, datasheets etc.) to assist with installation, operation, and diagnostics.

For additional support the user can use either of the following:

- Contact Us web link: [www.aparian.com/contact-us](http://www.aparian.com/contact-us)
- Support email: support@aparian.com
2. APPLICATION DESCRIPTION

The Aparian DF1 Router can be used to enable multiple modern Ethernet devices to communicate to legacy SLC500, PLC5 and MicroLogix devices via their DF1 serial ports. In the application example below, two PanelView800 terminals can read and write data to an SLC500.

Figure 1 - Example of a typical network setup
3. SETUP

The following sections will describe the installation and configuration of all the required devices to assist the user with the initial setup.

3.1. SERIAL CABLE WIRING

The serial cable pinout is shown in the figure below:

![Figure 2 – Serial Cable Pinout](image-url)
3.2. DF1 ROUTER SETUP

The DF1 Router must be configured in Transparent PCCC mode, as shown below.

![DF1 Router Configuration](image)

In the Serial-DF1 settings, the protocol must be set to Full Duplex. The BAUD Rate, Parity and Error Detection must match that of the SLC device (as configured using RSLogix 500).
No Transparent PCCC mapping items are required to be configured.

The PCCC Address allows the user to force the destination address of the DF1 message which is routed either via the PCCC protocol or the CIP embedded PCCC message.

**NOTE:** The PCCC Address is usually only relevant for DH485 networks. Thus, for the DF1 Router the default value of 1 can be left unchanged.

The user must **not** have the CIP over DF1 enabled.
3.3. RSLOGIX 500 SETUP

Using RSLogix500, the DF1 serial port must be configured to match that of the DF1 Router’s serial port settings with respect to BAUD rate, Parity and Error Detection.

**NOTE:** The DF1 Full Duplex must be selected, and the Duplicate Packet Detect option must be removed.

![Channel Configuration](image)

**Figure 7 – SLC Serial Channel Configuration**
3.4. PANELVIEW 800 SETUP

Open Connected Components Workbench and create a new project. The user will be prompted to add a device. Select a PanelView 800 model under the Graphical Terminals and press Select followed by Add to Project.

![PanelView 800 Add](image)

**FIGURE 8 – PANELVIEW 800 ADD**

The PanelView 800 (PV800) will now be added to the project tree on the left.

3.4.1. COMMUNICATION SETTING

Double click on the PV800 application in the tree to go to the settings page. The user will first need to setup the communication for the PV800.
Next the user will need to select the MircoLogix/ENI Protocol from the drop-down menu:
The user will need to select the MicroLogix 1400 Controller Type for any SLC or MicroLogix device that the PV800 will interface to. Enter the IP Address of the DF1 Router in the address textbox.

![Image of configuration settings](image)

**Figure 11 – Communication Parameters**

### 3.4.2. Tag Setup

Next the user will need to setup a Tag which the PV800 can use to communicate with the SLC/MicroLogix controller. The Tag Editor can be found by double clicking on the Tags in the project tree.
The user must first select the controller to be used. This will be the same as the one selected in the communication settings (can be selected from a drop-down menu). The user must then select the request communication address as well as the data type.

3.4.3. Testing Communication

To test the communication, the default screen can be selected by double-clicking on it in the project tree.
The user will first need to add the Goto Terminal Config button to the display. The user can then add a Numeric Display as well which will be used to show the value of the tag.

Next the user will need to assign the Tag created (TAG0001) to the numeric display. This is done by right-clicking on the numeric display and selecting properties. The properties window will generally be opened on the right-hand side of the screen. Under the Connections tab the user will need to select the Read Tag that will be used.
Once this is done the user can download the application to the PV800. This is done by right-clicking the Application in the project tree and selecting download.

The user will need to select the PV800 to which the application must be downloaded in the Connection Browser.
Once the application has been downloaded the user can verify the communication operation by viewing the actual PV800 to which the application was downloaded.
